EXPORT-CSV-v2: Task CSV export

Overview

Status: planned (not implemented yet). Users of taskboard-api need to download the tasks of a project as a CSV file for reporting in spreadsheets. This spec defines version 2 of the export contract (version 1 was an informal script and is retired).

Endpoint

GET /projects/{id}/tasks/export.csv

The route lives in the tasks router, the CSV rendering lives in the task service, following the layering described in the architecture overview. The route must be declared before /projects/{project_id}/tasks/{task_id} so that export.csv is not parsed as a task id.

Columns

The CSV has exactly these columns, in this order: id,title,status,assignee,created_at.

- id: integer task id
- title: task title
- status: one of todo, in_progress, done
- assignee: assignee email address
- created_at: ISO 8601 UTC timestamp of task creation (requires adding created_at to the task model)

Acceptance criteria

- AC-1: The response contains a header row with exactly id,title,status,assignee,created_at.
- AC-2: The response has Content-Type: text/csv (a charset parameter is allowed).
- AC-3: There is one data row per task of the project, ordered by ascending id.
- AC-4: Values containing commas, quotes or newlines are quoted per RFC 4180 (use the csv module).
- AC-5: A project without tasks returns 200 with the header row only.
- AC-6: If the project does not exist, the endpoint returns 404 as application/problem+json according to ADR-001.

Out of scope

Filtering by status, streaming of very large exports and other formats (XLSX, JSON lines).
